TITLE: Application of Reserpine (Serpasil) to Patients Suffering From Hypertonia (Primeneniye reserpina bol'nym gipertonicheskoy boleznyu)

PERIODICAL: Voyenno-meditsinskiy zhurnal, 1958, Nr 5, pp 35 - 38  
(USSR)

ABSTRACT: The author worked out 105 case histories of patients suffering from hypertension in the second and third stage, who were treated with reserpine without using other hypotensive means. Based on these results, the author concluded that: 1) the reserpine treatment of patients suffering from second and third stage hypertension has a considerable hypotensive effect. Reserpine can be used in combination with other hypotensive means; 2) a combined treatment with reserpine and other hypotensive preparations is expedient in case the reserpine administered to the patient remains ineffective in the course of three

Card 1/2

Application of Reserpine (Serpasil) to Patients Suffering From  
Hypertonia

weeks; 3) treatment with reserpine is to be started with small doses which can be increased gradually in case of insufficient hypotensive results; 4) myocardial infarction and cerebral insultus in the patient's anamnesis are no indication that reserpine should not be applied. There are 2 tablets.

TITLE: Interaction between a submerged turbulent jet and a solid wall

SOURCE: Zhurnal prikladnoy mekhaniki i tekhnicheskoy fiziki, no. 2, 1965, 50-53

TOPIC TAGS: Nusselt number, turbulent flow, turbulent jet, boundary layer, skin friction, Stanton number

ABSTRACT: The conservation law of wall turbulence relative to changes in boundary conditions was used to investigate the interaction between a submerged turbulent jet with a solid wall. The schematic of the flow is shown in Fig. 1 on the Enclosure. A momentum integral method is used to obtain the momentum conservation equation

$$\frac{dR^{**}}{dx} + \left[ 1 + \frac{\delta^*}{\delta^{**}} - \frac{\delta_1}{\delta^{**}} \right] \frac{R^{**}}{W_0} \frac{dW_0}{dx} = \frac{C_f}{2} R_* W_0$$

where

$$R^{**} = \frac{w_0 \delta^{**}}{v_0}, \quad X = \frac{x}{\delta^{**}}, \quad W_0 = \frac{w_0}{v_0}, \quad C_f = \frac{\tau_w}{\rho_{air} v_0^2}, \quad R_* = \frac{w_*}{v_0}$$

Card 1/63

L 52160-65

ACCESSION NR: AP5013370

and the velocity profile is determined from the one-seventh power law. An expression is derived for the skin friction coefficient  $C_f$  and, after a correlation with experimental data it, is reduced to the form

$$\frac{C_f}{2} = \frac{0.0314}{R_e^{0.2} X^{0.11}}$$

Using this expression in the definition of the Stanton number, two equations are obtained for the nondimensional heat transfer coefficient which, for the submerged wall jet, is given by

$$N_t = \frac{\alpha}{h} = 0.1197 \left( \frac{w_t x}{v_\infty} \right)^{0.6} X^{-0.4} P^{0.4}$$

and for the wall jet with a weak wake by

$$\frac{T(\text{pol})}{T(\text{sw})} > 3, \quad S_t = \frac{0.113}{R_e^{0.2} X^{0.11} P^{0.4}}$$

This latter equation is shown to coincide with the results of M. Jakob, R. Rose, and H. Spielman (Heat Transfer From an Air Jet to a Plane Plate With Entrainment of Water Vapor From the Environment. Trans. ASME, 1950, vol. 72, No. 6) for  $P = 0.71$ . Orig. art. has: 23 equations and 4 figures.

SOURCE: Zhurnal prikladnoy mekhaniki i tekhnicheskoy fiziki, no. 1, 1966, 115-120

TOPIC TAGS: heat transfer, cooling, thermal protection, wall cooling *1, 5*

ABSTRACT: Experiments were made to determine the efficiency of cold gas jets used for protecting duct walls from the heat transferred from a main gas stream. Cold air and air preheated to 55—100°C were used as the hot and cold gases. The cold air was injected at 1—6 m/sec through a slit parallel to a corrugated wall consisting of ebonite cylinder sections. These sections were mounted on a panel and placed in the 150-mm-wide rectangular test section. Velocity and temperature profiles were measured at the inlet and in various cross sections of the test section. The data were correlated in terms of the main gas flow viscosity, wall temperature, Reynolds number, and distance from the inlet. The efficiencies of cold gas jets for protecting smooth and corrugated walls are compared. Orig. art. has: 4 formulas and 11 figures [PV]

TITLE: Effectiveness of gaseous screening in a turbulent boundary layer 1,44,55

SOURCE: Zhurnal prikladnoy mekhaniki i tekhnicheskoy fiziki, no, 5, 1965, 142-146

TOPIC TAGS: turbulent boundary layer, transpiration cooling, temperature distribution, heat transfer, Reynolds number

ABSTRACT: The effectiveness of slot and porous wall injection on the temperature distribution of a wall immersed in a hot flowing gas is investigated. The two types of transpiration cooling are described schematically in Figs. 1a and 1b. The wall is assumed to be adiabatic, and the heat transfer coefficient is expressed by the Stanton number

$$S = \frac{A}{R^{0.75}} p^{-0.75}$$

Card 1/3

L 5383-66  
ACC NR: AP5027286

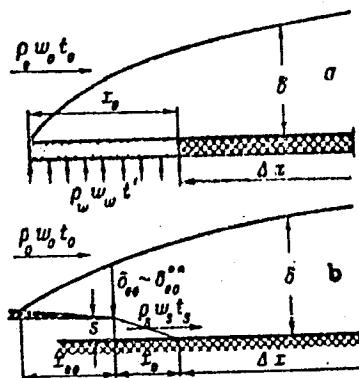

Fig. 1

For the porous wall case the wall temperature is described by the expression

$$\theta = \frac{t_0 - t_{aw}}{t_0 - t'} = \frac{\{(1 + 62.5(\mu_0 q^{-1} R_{\Delta x}^{0.8})^{-1.25})^{0.116} - 1\}^{0.8}}{\{(1 + 0.016(\mu_0 q^{-1} R_{\Delta x}^{0.8})^{1.25})^{0.16}\}^{0.8}}$$

Two similar equations are obtained for the single slot injection case which for  $m \ll 1$  becomes

$$\theta = \{(1 + 62(K + 0.143)^{-1})^{0.116} - 1\}^{0.8} \{1 + 0.016K\}^{-0.16}$$

Card 2/3

L 5383-66  
ACC NR: AP5027286

and for  $m \approx 1$  becomes  $0 = ((1 + 02.5(K + 2)^{-1})^{0.1} - 1)^{0.8} (1 + 0.010K)^{-0.16}$ .

All three equations above are shown graphically and compared with experimental data. The results are found to be satisfactory. Orig. art. has: 21 equations and 7 figures.

TITLE: Baffle cooling in the case of a current blowing into a turbulent boundary layer through multi-aperture and grid grates

SOURCE: Zhurnal prikladnoy mekhaniki i tekhnicheskoy fiziki, no. 3, 1966, 149-153

TOPIC TAGS: turbulent flow, boundary layer, cooled boundary layer

ABSTRACT: An analytic method is proposed for determining the effectiveness of baffle cooling of a plane thermally insulated wall when a cooling gas is delivered through grates. Results obtained for the cooling effect of a gas passing through a single aperture are shown to be applicable to the more complex problem. Equations for the degree of energy and momentum loss are introduced for the second aperture as an extension of those for the first. An estimate is then made of the effectiveness of heat protection, the measure of which is taken to be the temperature of the insulated wall. These estimates are shown to agree with experimental data. Orig. art. has: 23 formulas, 6 figures.

TITLE: Dynamic Models of Power Systems (O dinamicheskikh modelyah  
energosistem)

PERIODICAL: Elektrichestvo, 1958, Nr 9, pp 80 - 82 (USSR)

ABSTRACT: Remarks concerning the paper by I.S.Bruk in Elektrichestvo,  
1958, Nr 2. 1) According to the paper, the methods of  
using mathematical and physical models are contrary to  
each other. It is shown here that this is not correct  
and that a reasonable coordination of the two methods  
should rather be aimed at. 2) The author follows the  
opinion of M.P.Kostenko, V.A.Venikov and N.N.Shchedrin,  
and points out that for investigating transients in

Card 1/2

Dynamic Models of Power Systems

SOV/105-58-9-19/34

electric power systems one should combine the results gained with dynamic models with those obtained by the use of electronic digital computers. 3) The authors ask for a combined use of dynamic models and computers. They show that even in such fields where digital computers prevail, one cannot do without dynamic models. There are 3 Soviet references.

<p>CONTENTS. The book is a collection of reports submitted by scientific workers at plants, scientific institutes and schools of higher education at the Third All-Union Conference on Automation of Industrial Processes in Machine Building and Related Electric Drives in Industry held in Moscow on May 17-19, 1959. The conference was called by the Academy of Sciences USSR, the Soviet Acad. State Planning Commission AS USSR, the USSR, the Gosplanavtorg, Ministry of Construction, Ministry of Machine-Building (State Committee on Automation and Machine-Building), the National Com. on Automatic Controls (Scientific and Technical Committee on Automated Electric Drives), the RSC (Moscow Institute of Metallurgy), the VNIIM (Institute of Metallurgy and Ferromagnetism) and the Institute of Mathematics AS USSR (Commission on the Technology of Machine Building of the Institute of Science of Mechanics of the Academy of Sciences USSR). It was the purpose of the Editorial Board to range the reports in a way which would ensure a relatively systematic presentation of the material and present problems relating to electric drives and automatic controls of industrial plants used in various branches of industry. Due to problems of increased electric drive and their solution are outlined. The book also contains articles on elec- tric machinery and means of automation. Considerable attention is paid to semi- conductor automatic control systems, including systems with semiconductor devices and magnetic amplifiers, and to computers intended both for the analysis and the synthesis of linear and nonlinear automatic regulation and control systems. Re- ports already published in journals or official publications have been consider- ed separately. References to some of the papers, particularly those which have appeared in volume V of EII in transactions are mentioned.</p>

TITLE:

Some Optimum Correlations for an Ideal Magnetic Amplifier Governed by an a.c.-Signal (Nekotoryye optimal'nyye sootnosheniya v ideal'nom magnitnom usilitеле pri upravlenii signalom peremennogo toka).

PERIODICAL: Avtomatika i Telemekhanika, 1958, Vol. 19, Nr 1, pp. 85-94 (USSR).

ABSTRACT:

In this paper induction-coil amplifiers with an active load, which are fed by an input a.c.-signal, which is represented by modulated oscillations of the carrier wave are analysed. In the case of full-wave rectification the doubled frequency of the amplifier supply represents this carrier-frequency. Amplifiers of such a type are here referred to as a.c.-amplifiers. It is shown, that the determination of the coefficient of power amplification of an amplifier destined for a.c.-amplification according to the apparent and true power is ineffective. The formulae existing for this purpose do not permit to utilize fully the entire amplification scheme. Moreover, these formulae cannot be used for every type of magnetic amplifiers. It is proposed here to define the coefficient of power amplification as the ratio of the power output at a certain load to the maximum power, which can be delivered by the signal feeder at a tuned-in load. In the case of an ideal magnetic amplifier governed by a certain sinusoidal a.c.-signal the

Card 1/2

Some Optimum Correlations for an Ideal Magnetic Amplifier Governed 103-1-8/10  
by an a.c.-Signal.

maximum of power amplification (equalling the power maximum at load) occurs at a time lag of the governing circuit of the amplifier which is equal to the inverse value of the cyclic frequency of the signal. This condition determines the basic parameters of the amplifier and permits its economical lay-out. If it is desired to obtain a magnetic amplifier operating in a certain frequency range from  $\omega_1$  to  $\omega_2$  with a maximum mean coefficient of power amplification, then its time lag is to be selected according to  $\tau = 1/\omega_1 \omega_2$ . If the frequency distortion coefficient is known, the time lag of the amplifier is determined from the two equations given here (29) or (30). There are 6 figures, and 2 Slavic references.

Ekspluatatsiya setevykh sooruzheniy gorodskoy elektricheskoy seti (Operation of  
Line Structures of Municipal Electric Networks) Moscow, Gosenergoizdat, 1960.  
394 p. Errata slip inserted. 20,000 copies printed.

Ed.: A.P. Shcheglov; Tech. Ed.: O.S. Zhitnikova.

PURPOSE: This book is intended for the foremen, electricians, and other workers  
of municipal electric networks. It may also be used as a handbook by technical  
personnel engaged in the operation or design of municipal networks and technical  
personnel of electric networks servicing industrial establishments.

COVERAGE: The book examines the arrangement and operation of the electric equip-  
ment and structures of municipal electric networks. The procedure of operation,  
maintenance, repair work, and the technical norms for work and materials based  
on the existing regulations are indicated. Information is given on accident  
prevention measures. The book is based on experience gained from many years of

SOV/136-59-4-9/24

**AUTHOR:** Volchkov, N.A.**TITLE:** Some Problems in the Conversion of Arsenical Cobalt-Nickel Ores to Speiss (Nekotoryye voprosy pererabotki mysh'yakovistykh kobal'to-nikelevykh rud na shpeyzu)**PERIODICAL:** Tsvetnyye metally, 1959, Nr 4, pp 42-49 (USSR)**ABSTRACT:** In the post-war period a large deposit of cobalt-nickel arsenic ores has been discovered in Siberia, differing (Ref 5) from that being worked in the Caucasus. The aim of the author's work, carried out in 1955-57 on a laboratory and larger scale at the Ufaleyskiy nikellevyy zavod (Ufaley nickel works) was to supplement the scant published information on the smelting of such ores. The composition used was 2.0% Co, 2.9% Ni, 3.65% Fe, 15.67% As and 6.32% S, about 50% being represented by primary arsenides and 50% by arsenic oxidised minerals (table 1). To find the influence of added carbon on the yield and composition of the speiss and slag, 40-60 kg samples of ore in the works stockyard were taken and analysed (results are shown in table 2). 100-500 g of ore and 0-10% of its weight of metallurgical coke were

Card 1/5

SOV/136-59-4-9/24

Some Problems in the Conversion of Arsenical Cobalt-Nickel Ores  
to Speiss

used for laboratory smelting tests. The charge was (1 mm size) heated to 1350-1400°C, maintained at this temperature for 30 minutes and then cooled in air. The solidified product was broken up and the speiss separated from the slag. For the larger-scale work 20 kg of ore, 0.8 kg coka, 0.8 kg lime and 0.6 kg fluorspar crushed to 3-5 mm were heated to 1300°C, maintained at this temperature for a few minutes and then cooled in air. The author discusses the theory of ore smelting to speiss in terms of the behaviour of various elements. He concludes that with a partially oxidised ore this should be effected in a reducing atmosphere and that the basic facts for arsenical cobalt-nickel ore is the greater affinity of cobalt and nickel, compared with iron, towards arsenic than towards oxygen, as a result of which iron goes into slag and cobalt and nickel into speiss. Table 3 shows ore and speiss compositions, charge coke-content and speiss yield for the laboratory experiments, the yield increasing

Card 2/5

SOV/136-59-4-9/24

Some Problems in the Conversion of Arsenical Cobalt-Nickel Ores  
to Speiss

with increasing charge coke content. The speiss composition as a function of the reducing-agent content of the charge being shown in Fig 1. The total cobalt and nickel content of the speiss is sufficient for the hydrometallurgical extraction of these metals. The different degrees of concentration (content in speiss: content in ore) for the different metals in relation to the reducing-agent content of the charge is shown in Fig 2 for the smelting of two ores. By changing the reducing-agent content the ratio of cobalt and nickel to iron in the speiss can be altered. The distribution of cobalt and nickel between speiss and slag is shown in Fig 3 as functions of the  $[Fe]:(Fe)$  ratio; Fig 4 shows that of cobalt as functions of  $[Fe]:(Fe)$  and of  $[Fe + Ni]:(Fe + Ni)$ . As shown by the tabulated results (table 4) the arsenic content of the speiss has not much effect on the cobalt and nickel distributions, though there is some tendency for the distribution coefficients to decrease when

Card 3/5

SOV/136-59-4-9/24

*Some Problems in the Conversion of Arsenical Cobalt-Nickel Ores  
to Speiss*

(cobalt + nickel + iron) : arsenic in the speiss decreases. The values of the nominal equilibrium coefficients given in this table agree well with some published values (Ref 7, 8, 9). Table 5 gives data on the recovery of cobalt and nickel into the speiss for the laboratory tests: maximal recovery was obtained with 4 to 6% coke in the charge, the cobalt and nickel losses in the slag then being 0.62 to 1.95 and 1.27 to 2.95% respectively. By regulating the reducing-agent content of the charge the degree of removal of sulphur and arsenic into the gas could be varied. The slag composition corresponding to minimal cobalt and nickel contents was found in the flux-less experiments to be 38 to 42% SiO<sub>2</sub>, 34 to 36% CaO, 6 to 8% FeO, 4.6% MgO and 12 to 16% Al<sub>2</sub>O<sub>3</sub>, which was highly fluid at 1400°C. The author concludes that his work proves the possibility of applying flux-less smelting in a

A contactless transmitter

A triode of the type П4Y (P4U) is used as generator of the sinusoidal oscillations. Its collector circuit is connected to the winding of a relay. The interconnected collector and base circuits of the triode generate self-oscillations and there is mutual induction between the windings  $L_1$  and  $L_2$ , situated at some distance apart. When a metallic screen is introduced into the air gap between the windings  $L_1$  and  $L_2$ , the oscillations of the generator cease. The resistance of the collector circuit of the triode in the absence of oscillations is much smaller than in their presence and, thus, the current in the collector circuit increases when the oscillations cease. The current increase brings the relay into operation. The relay of the transmitter is 20V. The transmitter works in a stable manner when the distance between the faces of the transmitter is 40 mm or less. The accuracy of the breaking screen position is 1 mm when the width of the metallic screen is equal to the double width of the face; the limiting factor for the speed of the screen is the relay speed. The transmitter of the type (DIP-1) works in a stable manner at a screen speed of up to 16 mm per/sec.

AUTHOR: Volchkova, N.S. Engineer

TITLE: The need of new devices for insulation inspection

PERIODICAL: Stroitel'stvo truboprovodov, no. 12, 1960, 16

TEXT: The modern method of lowering pipelines into the trench immediately after insulation calls for urgent development of a new device for inspecting and checking the quality of the insulation. The flaw detector offered by VNIIST applies rather to the old technology, whereby pipes were insulated and lowered separately into the soil. In the opinion of the author the problem could be solved best by combining the design of the experimental flaw detector of VNIIST, which was tested in 1960 and the device proposed by Rumyantsev, Chief Mechanic of the SU-5 trust of Mosgazprovodstroy. In accordance with this proposal the heavy electric part of the mechanism of the device should be placed on the insulator and the light metal ring on the pipeline, both moving along as the work progresses. Unfortunately a trial model providing for such a combination has not yet been produced. The author further comments on the flaw detector issued by VNIIST intended for heavy and extra-heavy insulation. Practical tests on the pipeline con-

Card 1/2

The need of new devices for insulation inspection

8/095/60/000/012/002/003  
A053/A129

struction Serpukhov-Leningrad revealed serious shortcomings of the proposed device. In this connection the question arises whether there is any use in a flaw detector for heavy insulation which signals only the presence of complete lack of insulation in certain places and not insufficient thickness of same. Even flaw detectors working on a voltage of 36,000 v do not locate a defect consisting in a layer of insulation as thin as a tenth of a millimeter. In case of extra-heavy insulation the flaw detector does not react to such changes in the thickness of the insulation as a drop from 9 to 1 - 2 mm. A flaw detector must be able to register any difference in the thickness of insulation layers. It is up to VNIIST to develop such a device. The magnetic thickness meters offered by VNIIST can only be used with insulated pipes lying on ground rests. There is also need of a device capable of revealing the strength of cohesion between pipe and insulation. The idea of such a device has not been pursued beyond the issue of a test model.

AUTHOR: Volchok, B. A.

TITLE: Optimum regime of the zone levelling process

PERIODICAL: Fizika tverdogo tela, v. 3, no. 11, 1961, 3549-3550

TEXT: Earlier papers of the author (Ref. 1: B. A. Volchok, FTT, 3, 1233, 1961; Ref. 2: B. A. Volchok, V. Ya. Frenkel', FTT, 8, 2010, 1961; Ref. 3: B. A. Volchok, V. Ya. Frenkel', IFZh, avgust, 1961) are supplemented by a) calculating that width  $b = b(l)$  of the fluid zone at which the levelling process is completed already after two cycles, and b) by application of the formulas obtained to the alloying process. a)  $b_1$  denotes the value of  $b(l)$  at the left end of the sample,  $b_0$  the value of  $b(l)$  at the right end,  $Y'_0 = \text{const}$  is the initial distribution of the admixture,  $k = \text{const}$  is the segregation coefficient,  $l_0$  is the sample length. Proceeding from the equations for the concentration given in Ref. 2.

Card 1/4

Optimum regime of the zone ...

S/181/61/003/011/053/056  
S109/B102

$$2 \frac{k}{b_1} y_{10} d + C = (Y_0 + y_{10}) z + (1 - k) Y_0 \exp(-z). \quad (6)$$

is obtained for the first two cycles for the sought  $b(1)$  where

$$C = (1 - k) \exp\left\{-\frac{k}{b_1}(l_0 - b_1)\right\} - k. \quad (7)$$

In this case  $y_2(1) = y_1(1 - b/2)|_{l=1_0-b_1/2}$   $y_{10} = Y_0 [1 - (1 - k) \exp\left\{-\frac{k}{b_1}(l_0 - b_1)\right\}]$

b) The alloying process differs from the zone levelling process only in that the initial distribution of the admixture in the sample (apart from the fluid zone) is equal to zero. Hence, in analogy to Ref. 1,

Card 2/4

Optimum regime of the zone ...

S/181/61/003/011/053/056  
B109/B102

$$y_{2n}(x+k) = \frac{ky_0}{1+x_0-k} \times \\ \times \left[ 1 - \frac{4y}{x_0-k} \frac{\cos \frac{x_0-x-k}{x_0-k} y}{\sin y \left[ 1 + \frac{y^2}{(x_0-k)(x_0-k+1)} \right] \left[ 1 + \frac{y^2}{(x_0-k)^2} \right]^n} \right], \quad (8)$$

$$y_{2n+1}(x) = \frac{ky_0}{1+x_0-k} \times \\ \times \left[ 1 - \frac{4y}{x_0-k} \frac{\cos \frac{x_0-x-k}{x_0-k} y - \frac{y}{x_0-k} \sin \frac{x_0-x-k}{x_0-k} y}{\sin y \left[ 1 + \frac{y^2}{(x_0-k)(x_0+1-k)} \right] \left[ 1 + \frac{y^2}{(x_0-k)^2} \right]^{n+1}} \right], \quad (9)$$

are obtained for an arbitrary number of cycles where  $y$  is the first positive root of the equation (22) in Ref. 1. There are 3 Soviet references.

ABSTRACT: A comparison was made between high-speed deformation pressure  
and theoretical strength in the impact region, when fusion of metals occurs. For  
an intensive plastic flow, deformation of the surface layers of plates, the genera-  
tion of heat in them, and the formation of metallic bonds, it is necessary to achieve  
pressures corresponding to the order of theoretical strength. From investigations  
it is deduced that the process of high-speed setting is actually determined only by  
the elastic properties of the materials, irrespective of their macrostructure.

ABSTRACT: A casting department, designed by the <u>MNIIPMTMSh</u> institute for producing 1000 tons/year, is described. The project includes three independent sections: a -- section for producing low temperature melting patterns, application of heat resistant layers, drying of the molds and burning out the patterns; a section for drying, forming, firing, pouring, and removal of the castings; a section for trimming, cleaning, and leaching of the castings. Yearly output per worker will be 1.5 times higher than at the casting department of the <u>Podol'sk mechanical factory</u> and 2.5 times higher than at the existing casting department of the Kuznetsk factory. 4 illustrations. \*Anodic Evolution of Oxygen on Nickel in Alkaline Solutions.  
I. M. Vodchikova and A. I. Krasil'shchikov (*Zhur. Fiz. Khim.*, 1949, **23**, (4), 441-444).—[In Russian]. The electrode potential of a pure Ni anode in KOH soln. of concentrations from 0.01 to 5.0 was measured at c.d. of  $10^{-4}$ - $10^{-3}$  amp./cm.<sup>2</sup> and temp. of 20°-95° C., the electrolyte being saturated with air. Curves of electrode potential against c.d. showed two branches: that below  $10^{-4}$  amp./cm.<sup>2</sup>, corresponding to the formation of an oxide layer on the anode, and that from  $10^{-4}$  to  $10^{-3}$  amp./cm.<sup>2</sup>, corresponding to the evolution of O<sub>2</sub> from the anode. For the latter branch the variation of potential  $\phi$  with c.d.  $i$  and alkali concentration [OH<sup>-</sup>] at temp.  $T$  is given by:  $\phi = A' + 2/3(RT/F) \log i - 5/3(RT/F) \log [OH^-]$ ,  $R$  being the gas const. This relation is satisfied by the following mechanism for the evolution of O<sub>2</sub>: (I) OH<sup>-</sup> —  $\Theta$  → OH, (II) OH + OH<sup>-</sup> → H<sub>2</sub>O + O<sup>-</sup>, (III) O<sup>-</sup> —  $\Theta$  → O<sub>2</sub>, and (IV) O + O → O<sub>2</sub>, in which stage (III) limits the velocity

of the whole reaction. This assumed mechanism gives:  $\phi = A' + 2/3(RT/F) \log i - 5/3(RT/F) \log [OH^-]$ , which is in good agreement with experiment.—G. B. H.

Anodic behavior of nickel in alkaline solutions. I. M. Volchikova, L. G. Antonova, and A. I. Krasil'shchikov. *Zhur. Fiz. Khim.* 23, 714-18(1949); cf. *C.A.* 43, 6523d. Curves (c.d., against applied voltage) of anodic polarization of Ni in 0.1 N or 5 N KOH soln. with H show direction changes at 0.18-0.07 v. (against H electrode in the same soln.) owing to formation of  $\text{Ni(OH)}_2$  and at 1.41-1.31 v. owing to oxidation of  $\text{Ni(OH)}_2$  to  $\text{NiO}_2$ . At higher voltages,  $\text{O}_2$  is liberated on  $\text{NiO}_2$ . A kink at about 1.37 v. is visible also on charging curves (amt. of electricity passed against voltage) and on polarization curves in KOH soln. std. with air. In the presence of KCl the potential of 1.37 v. cannot be reached as Ni dissolves (is pitted) at smaller voltages. The concn. of KCl required for this effect increases with the concn. of KOH. J. J. B.

"Anodic Separation of Molecular Oxygen," A. I. Kravtsov, L. M. Volchikova, I. G. Antonova

Zhur Fiz Khim, Vol 27, No 4, pp 512-516

Investigated the process of electrochem sepn of mol oxygen at a Ni surface in alk solns at the expense of the oxidation of perhydroxyl ions HO<sub>2</sub>. Found that the anodic separation of mol oxygen takes place at the surface of the oxide Ni(OH)<sub>2</sub> without participation of any higher oxides of Ni because mol oxygen is inert towards the electrode surface.
